

ORCA ANATOMY

Side View

Dorsal should reside around the middle of (4)

Eyepatches vary in length and size, but they should generally start above the mouth chip, and end about the start of the pec

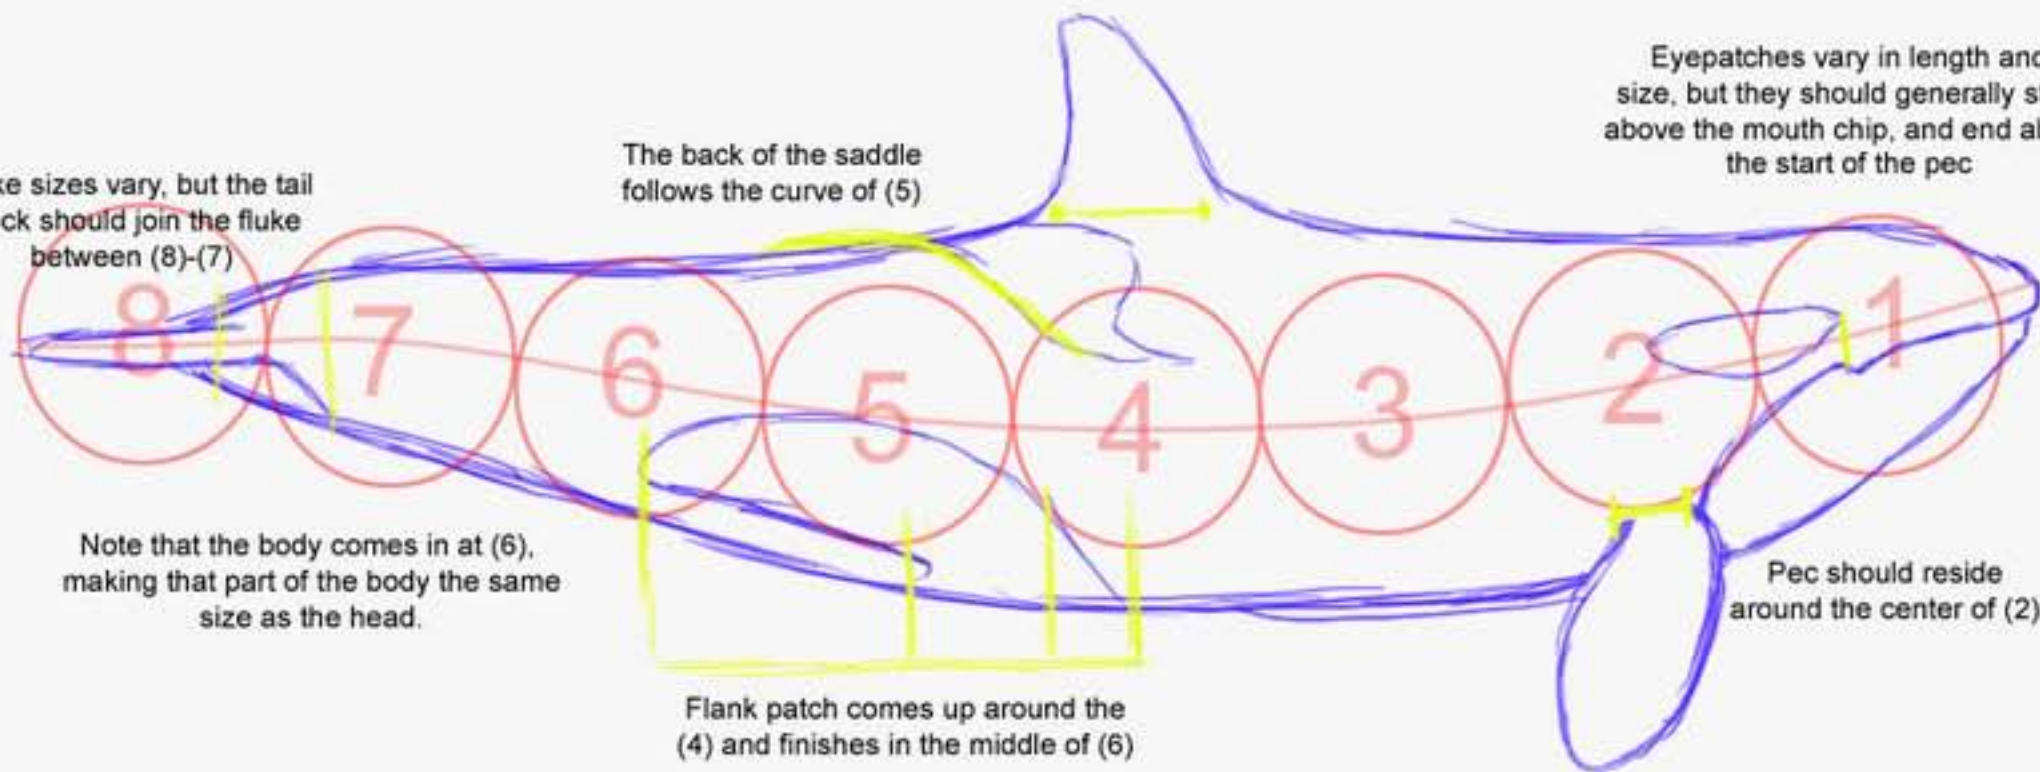

The back of the saddle follows the curve of (5)

Fluke sizes vary, but the tail stock should join the fluke between (8)-(7)

Note that the body comes in at (6), making that part of the body the same size as the head.

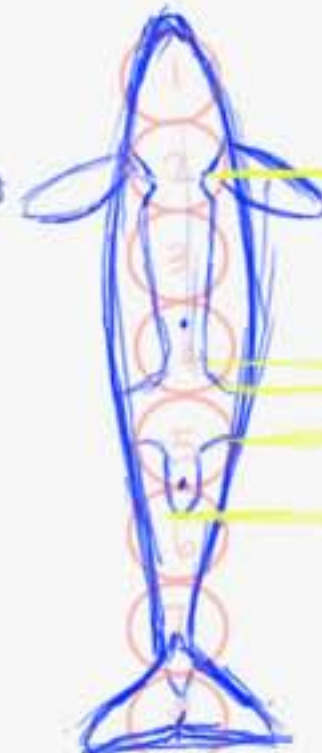

F flank patch comes up around the (4) and finishes in the middle of (6)

Pec should reside around the center of (2)

Top View

Bottom View

White markings pinch in from the jaw at (2)

The underside of the white markings are roughly the same length (just a tad shorter) as the flank patches.

This is the rough estimated anatomy of an adult female orca
